

BITMEN

Product Code: 108IR

Bitmen Infrared Asphalt Heater 1400mm x 550mm

The propane gas-fired infrared asphalt heater is used to repair asphalt surfaces – potholes and surface defects – quickly and efficiently.

**Additional sizes
also available.**

The heat penetrates the asphalt, softening the binder content to a point where the material becomes workable. Other systems which use a naked flame tend to burn and destroy the road surface, whereas infrared heat does not impair the quality of the material.

The heated material can be removed or – since it is not displaced in any way by the heater – may be rolled again to provide a good wearing surface. Alternatively, new material, including pre-coated chips can be added and rolled-in to improve the road surface.
